

Doesnt work because in my constructor method i listed that there will be 5 parameters within and in my main method for my food class i only have 3 parameters which dont meet the requirements.

```
DecimalFormat formatter = new DecimalFormat("#.##");  
food order = new food();  
  
food burgers = new food("burger", 1.85, 9, 33, 1);  
food salads = new food("salads", 2.00, 1, 11, 5);  
food fries = new food("11, 36, 4");  
food soda = new food(0, 38, 0);  
// prompting user for how many burgers, fries, salads, and so
```

```
System.out.println("Enter number of french fries: ");  
fries = input.nextInt();  
System.out.println(" ");
```

Doesnt work because iam defining 'fries' twice
