

Used scanner wrong, and defined usernumbr again, and having both int and double

```
6
7
8
9 public static void inchToCenti (int usernumbr) {
10     //declaring variables for conversion calculations
11     Scanner input = new Scanner(System.in);
12     double usernumbr = input.nextInt();
13
14     double conversion = usernumbr * 2.54;
15
16 }
17
18 public static void feetToCenti () {
```

Didnt include print statement in the method

```
public static void inchToCenti (int usernumbr) {
    //declaring variables for conversion calculations

    double conversion = usernumbr * 2.54;
    System.out.println("Your new measurement is: " + usernumbr + "cm");
}
```

solution:

```
public static void inchToCenti (int usernumbr) {
    //declaring variables for conversion calculations

    double conversion = usernumbr * 2.54;
    System.out.println("Your new measurement is: " + conversion + "Cm");
}
```
